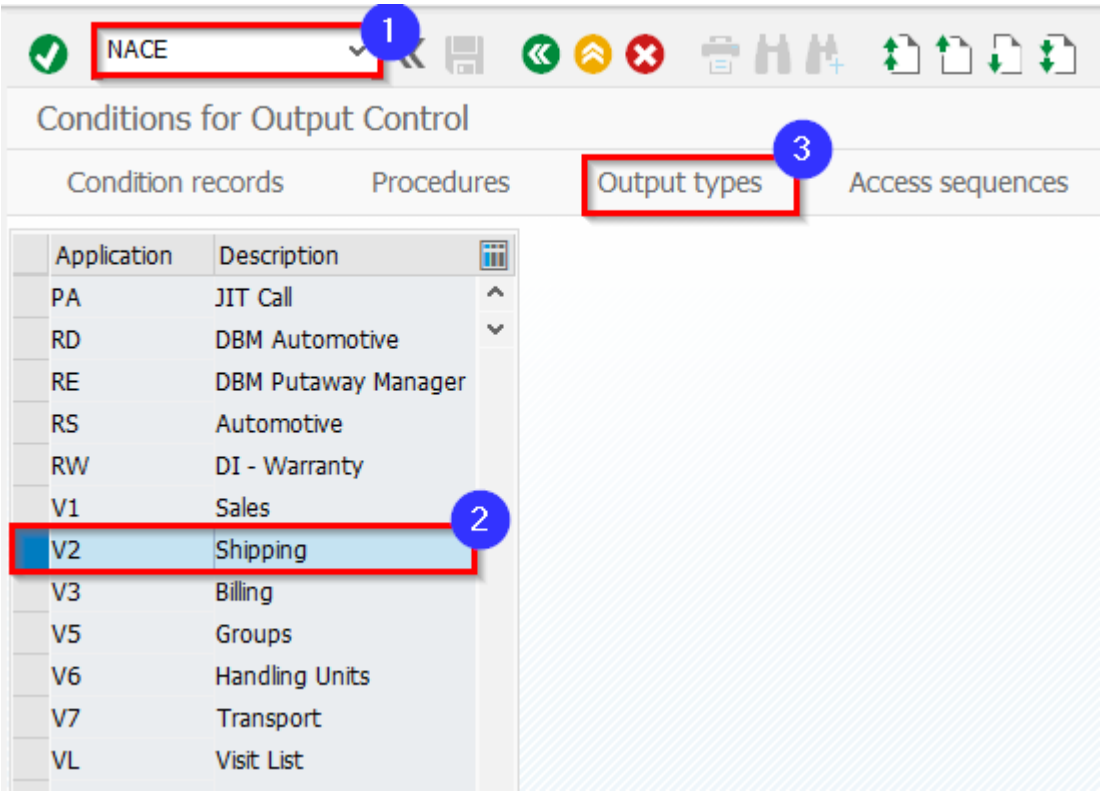
View the Output type settings in NACE

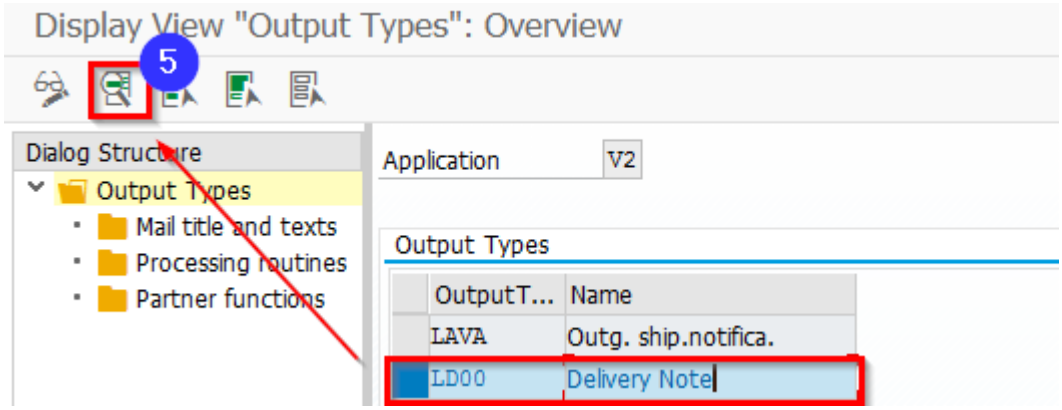
The **NACE** transaction is used to search the Output type related to a particular Application. Also you can create Procedures and assign any Outputs to them.

In general, I am using **NACE** to find a Printing form and the Driven program for the Output.

1) Run the transaction **NACE**
2) Select necessary Application type
3) Press the “Output types” button

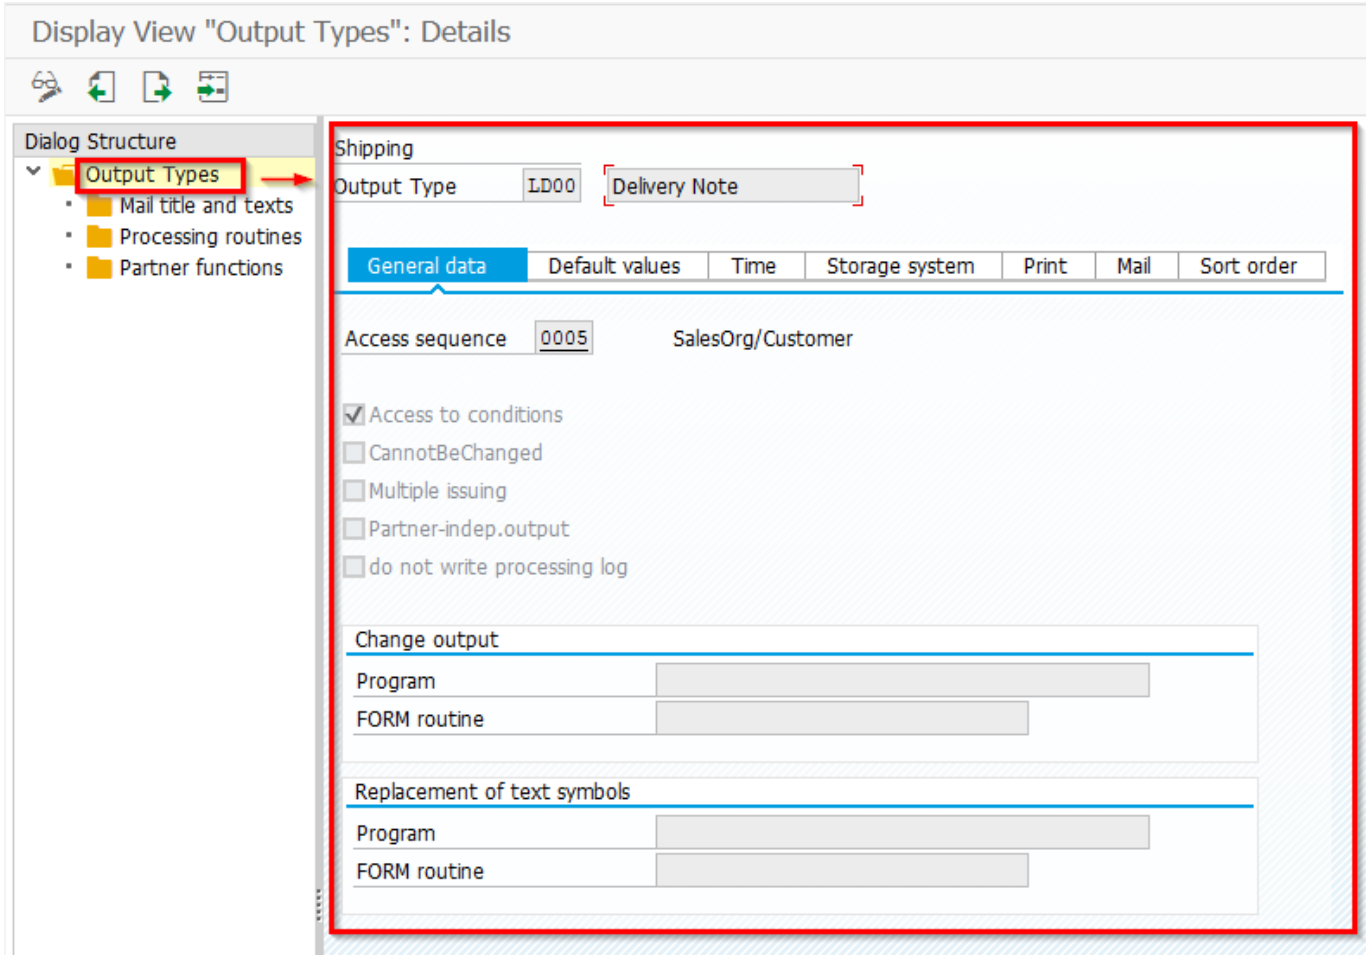


4) Select a necessary Output and press “Details”



View Output settings: General data,Default values, etc….

Output Types – table **T685B**



Mail titles and texts – table **TNATI**
